Bishop: what the teacher saw, what the bot did

Direction → key level and liquidity → confirmation → protected stop → objective.

Work in progress: the bot finds trade ideas, but these two illustrated entries are not verified matches. Outcomes below are hypothetical independent candidate tests, with zero trading costs.

Teacher’s intended flow

Daily bearish breakout → H4 breakout with inducement → H3 engulf confirmation.

The screenshot shows a sell plan, with price still above its drawn target. It does not establish a completed winning trade.

1. Original teacher chart

The teacher’s drawn plan is the reference; IC Markets may have different candles and prices.

2. Bot’s observed candles and candidate

Teacher’s demonstrated timeframe. A different model still remains a different confirmation.

EXPIRED

Plan	Entry	Stop	Target
Teacher drawing	1.96156	1.96472	1.94902
Bot candidate	1.96255	1.96377	1.95512

Why this stop: 1.96372 (linked candle extreme)

Fill: No confirmed fill for this candidate.

26 contexts share this displayed plan. Different models and prices remain alternatives; do not sum them as independent trades. Dashed grey lines show source drawing prices only, not source entry timing. Later candles remain visible after exits; the outcome comes from execution replay, not assumed paths through these aggregate candles.

3. What still differs

The observed H3 candle pair misses strict body engulf by two ticks. The bot found standing-extreme and breakout alternatives; neither verifies the illustrated engulf.

Stop check: the displayed model stop protects its linked wick and any other model-required objects. That does not establish that it is Bishop’s illustrated stop.

Execution check: uncertain within-candle sequences remain uncertain. GBPUSD ambiguous orders use the complete, H1-consistent M5 refinement; the incomplete M1 feed does not replace it.

This page uses frozen replay results and IC Markets candles. It does not rerun detection, select the best-performing candidate, or modify the teacher’s examples. All times below are UTC. Source screenshot timestamps are creation times, not verified entry times.

Bishop: what the teacher saw, what the bot did

Direction → key level and liquidity → confirmation → protected stop → objective.

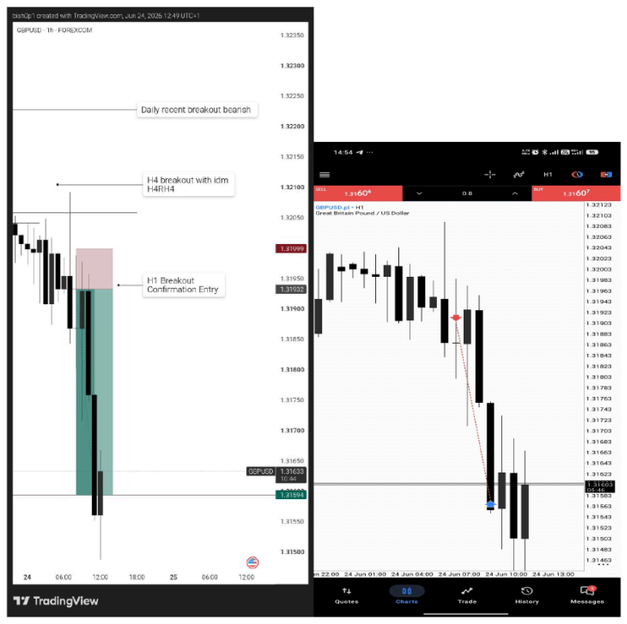

Work in progress: the bot finds trade ideas, but these two illustrated entries are not verified matches. Outcomes below are hypothetical independent candidate tests, with zero trading costs.

Teacher’s intended flow

Daily recent bearish breakout → H4 breakout with inducement → H1 breakout confirmation.

The page includes a later trade screenshot showing the downward move. Exact source setup and fill clocks have not been aligned with this feed.

1. Original teacher chart

The teacher’s drawn plan is the reference; IC Markets may have different candles and prices.

2. Bot’s observed candles and candidate

Plan	Entry	Stop	Target
Teacher drawing	1.31932	1.31999	1.31594
Bot candidate	1.31942	1.32052	1.31631

Why this stop: 1.32047 (linked candle extreme); 1.31954 (nearby structure)

Fill: 06-24 03:00 UTC to 06-24 04:00 UTC

6 contexts share this displayed plan. Different models and prices remain alternatives; do not sum them as independent trades. Dashed grey lines show source drawing prices only, not source entry timing. Later candles remain visible after exits; the outcome comes from execution replay, not assumed paths through these aggregate candles.

3. What still differs

The bot detects sell confirmations on H1, but its candle/level, protective wick and objective differ from the drawing. The actual capped portfolio selected no sell orders; outcomes here test candidates independently.

Stop check: the displayed model stop protects its linked wick and any other model-required objects. That does not establish that it is Bishop’s illustrated stop.

Execution check: uncertain within-candle sequences remain uncertain. GBPUSD ambiguous orders use the complete, H1-consistent M5 refinement; the incomplete M1 feed does not replace it.
